

Among individuals at average risk for colorectal cancer, should screening be initiated at age 45 instead of 50?

YES!

Increasing CRC risk under age 50

Base Case Cost-effectiveness (discounted)

	Colo 45-75 vs. 50-75	FIT 45-75 vs. 50-75
People (n)	1,000	1,000
Incr #colo	758	267
CRCs averted	4	4
CRC deaths averted	2	1
QALYs gained	14.4	14.0
Incr cost	\$486,500	\$107,800
Cost/QALY	\$33,900	\$7,700

Current screening participation

Why start screening at 45?

- Today's 45 year-olds are like yesterday's 50 year-olds
- No reason to believe screening “won't work” at 45-49
- It is estimated to be cost-effective – and we can do it!
- Start the message early – people act late

60 is
the new
40

**For CRC screening,
45 is the new 50!**

Among individuals with a low risk adenoma (1-2 adenomas <10mm in size) should a shorter (e.g. 5 year) versus a longer (e.g. 10 year) follow up interval be recommended?

YES!

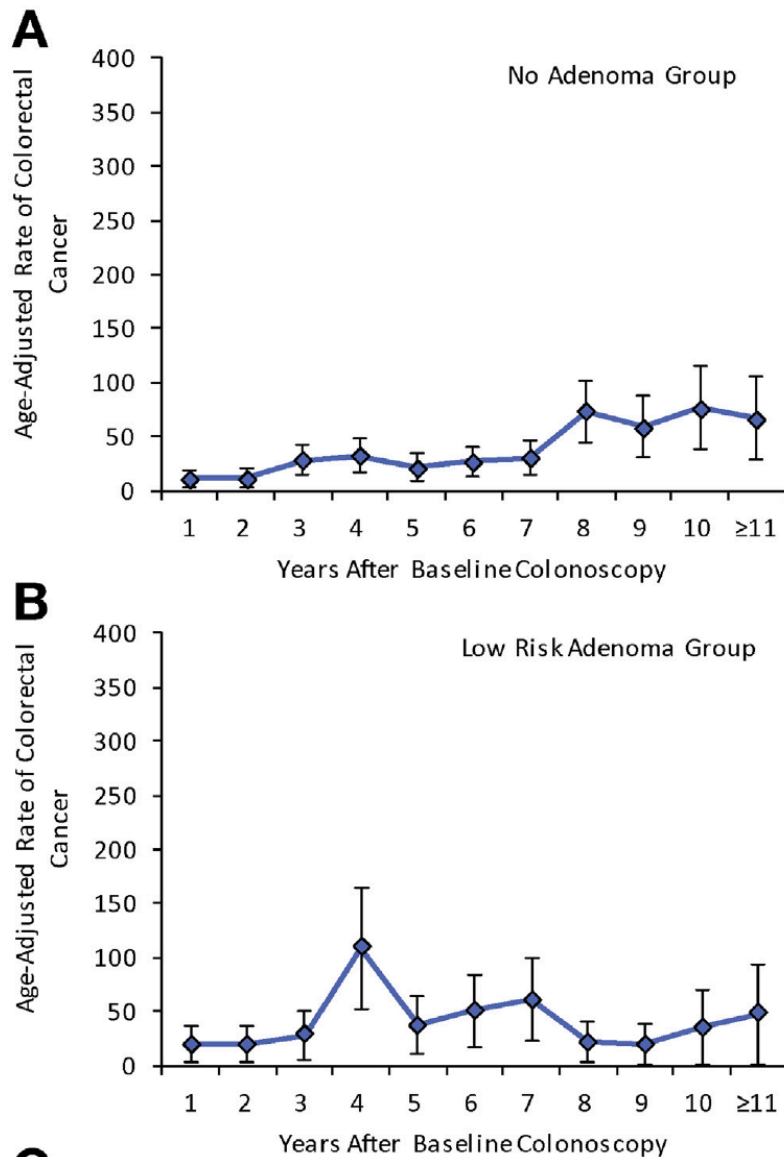

PLCO follow-up

PLCO follow-up

Kaiser NorCal

Kaiser NorCal

A

	No Adenoma Group	No adenoma	Low-risk adenoma
Subsequent colonoscopy, by year 6		9.3%	
Cumulative incidence of advanced adenoma, by year 6		1.7%	

(referent) Adenoma Adenoma

Kaiser NorCal

A		
No Adenoma Group		
	No adenoma	Low-risk adenoma
Subsequent colonoscopy, by year 6	9.3%	<u>40.5%</u>
Cumulative incidence of advanced adenoma, by year 6	1.7%	<u>4.1%</u>

Surveillance at 5 vs. 10 years

Surveillance at 5 vs. 10 years

Surveillance at 5 vs. 10 years

Surveillance at 5 vs. 10 years

Why do LRA surveillance at 5 years?

- Even with interval surveillance in LRA, upper bound of CI includes meaningfully increased risk vs. no adenoma
- Without interval surveillance at <10 years, CRC risk may well be higher vs. no adenoma
- It may take >15 years to see effect (not studied yet; modeled)
- It is estimated to be cost-effective – and we can do it!

THE SQUEEZE***

Among individuals at average risk for colorectal cancer, should screening be initiated at a later age for women than men?

No!

Number needed to screen by age and sex

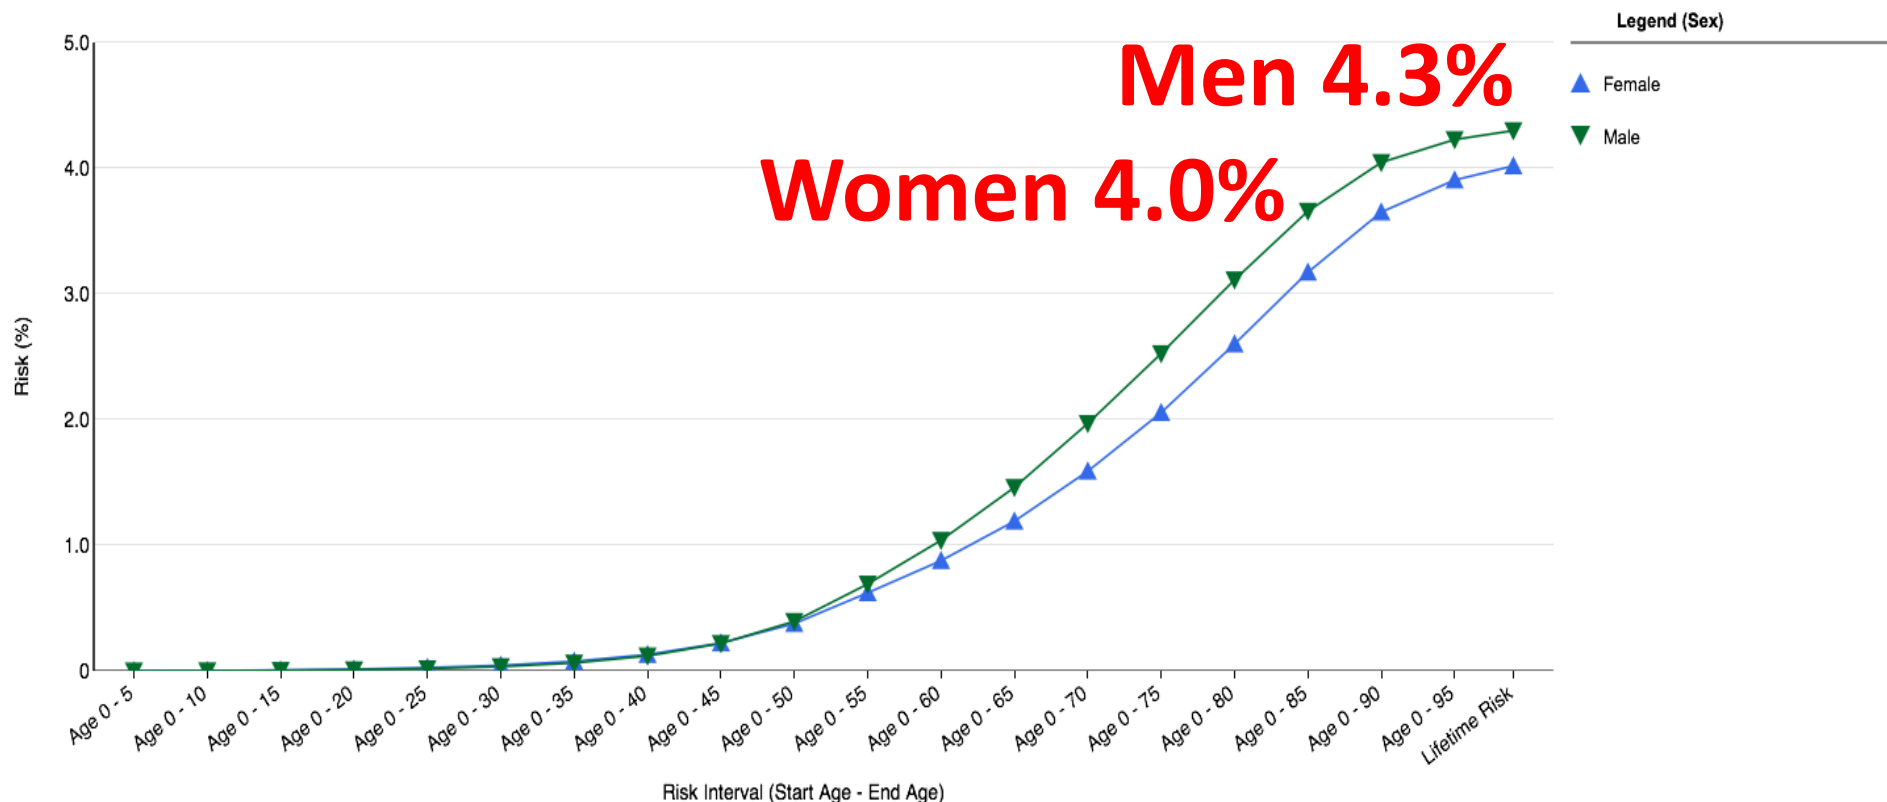

Figure 1. Numbers Needed to Screen in Order to Detect Advanced Neoplasia in the Large Bowel, According to Age Group and Sex.

All differences between men and women in the same age group were significant. Participants 40 to 49 years of age had different inclusion criteria than older participants, including a family history of any neoplasm (66.3% had a family history of colorectal cancer).

Lifetime risk: Women vs. Men

Colon and Rectum Cancer
Cancer Risk From Birth Over Time, 2015-2017
By Sex, All Races (includes Hispanic), Risk of Being Diagnosed with Cancer

Created by <https://seer.cancer.gov/explorer> on Sun Sep 20 2020.

Underlying Incidence data are from the SEER 21 areas [<http://seer.cancer.gov/registries/terms.html>] (San Francisco, Connecticut, Detroit, Hawaii, Iowa, New Mexico, Seattle, Utah, Atlanta, San Jose-Monterey, Los Angeles, Alaska Native Registry, Rral Georgia, California excluding SF/SJM/LA, Kentucky, Louisiana, New Jersey, Georgia excluding ATL/RG, Idaho, New York and Massachusetts).

Underlying Mortality data are from the NCHS public use data file for the total US.

Risk estimates are calculated using the [DevCan](http://surveillance.cancer.gov/devcan/) application.

Rates for American Indians/Alaska Natives only include cases that are in a Purchased/Referred Care Delivery Area (PRCDA). See SEER Race Recode Documentation for American Indian/Alaskan Native Statistics

[http://seer.cancer.gov/seerstat/variables/seer/race_ethnicity/#ai-an].

Hispanics and Non-Hispanics are not mutually exclusive from whites, blacks, Asian/Pacific Islanders, and American Indians/Alaska Natives.

Incidence data for Hispanics and Non-Hispanics are based on the NAACCR Hispanic Latino Identification Algorithm (NHIA) and exclude cases from the Alaska Native Registry. See SEER Race Recode Documentation for Spanish-Hispanic-Latino Ethnicity

[http://seer.cancer.gov/seerstat/variables/seer/race_ethnicity/#hispanic].

See the Policy for Calculating Hispanic Mortality [http://seer.cancer.gov/seerstat/variables/mort/origin_recode_1990+/index.html] for information about underlying Hispanic mortality rates.

Cancer sites are defined using the SEER Site Recode ICD-O-3/WHO 2008 Definition [https://seer.cancer.gov/sitecode/icdo3_dwhome/index.html] and the [SEER Cause of Death Recode 1969+ \(04/16/2012\)](https://seer.cancer.gov/coderecode/1969+_d04162012/index.html).

"Average Risk" CRC Screening

One Size Fits All

or

**Personalized
Tailoring?**

Why screen women the same as men?

- Epidemiological differences are not dramatic, and women live longer
- Age 45 is acceptable for both sexes
- If aim for better risk stratification, sex is only one factor
- Avoid confusion in guidelines and suspicion by patients
 - Delaying a benefit in women?
 - Or sparing a burden in women?
